## Friday Worksheet

Name: $\qquad$

## Acid base equilibria worksheet 2

1) Consider the two solutions below at $25^{\circ} \mathrm{C}$
i. $\quad 100.0 \mathrm{~mL}$ of 0.100 M HCOOH
ii. $\quad 100.0 \mathrm{~mL}$ of 0.100 M HCl
a) What is the pH of each solution?
b) The pH of which solution will undergo the greatest change when 900 mL of water is added to the solution. Explain
2) The ionisation of ethanoic acid can be represented by the equation
$\mathrm{CH}_{3} \mathrm{COOH}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{I}) \rightleftharpoons \mathrm{CH}_{3} \mathrm{COO}^{-}(\mathrm{aq})+\mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq})$
Which of the following solutions has the highest percentage ionisation. Verify mathematically and show all working out.
A. $50 \mathrm{~mL} 1.0 \mathrm{M} \mathrm{CH}_{3} \mathrm{COOH}$ solution.
B. $100 \mathrm{~mL} 0.01 \mathrm{M} \mathrm{CH}_{3} \mathrm{COOH}$ solution.
3) A 20.00 mL aliquot of a $0.200 \mathrm{M} \mathrm{CH}_{3} \mathrm{COOH}$ (ethanoic acid) is titrated with 0.150 M NaOH . The equation for the reaction between the ethanoic acid and NaOH solution is represented below.

$$
\mathrm{OH}^{-}(\mathrm{aq})+\mathrm{CH}_{3} \mathrm{COOH}(\mathrm{aq}) \rightarrow \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{CH}_{3} \mathrm{COO}^{-}(\mathrm{aq})
$$

What volume of the NaOH solution is required to completely react with the ethanoic acid?
4) A weak acid has a $\mathrm{K}_{\mathrm{a}}$ of $10^{-4.994}$ at $25^{\circ} \mathrm{C}$ and the solution pH is 4.523 . What percentage of the acid is ionised?
