Lesson 3a - dilution before titration

The acetic acid (ethanoic acid) concentration of a brand of vinegar is to be determined using volumetric analysis. A 20.00 mL aliquot is taken from the original bottle of vinegar and placed in a 200 mL volumetric flask and made to the mark using distilled water.
A volume of 25.00 mL was transferred from the volumetric flask to a 100 mL conical flask and titrated to the end point using a standard solution of $0.201 \mathrm{M} \mathrm{NaHCO}_{3}$. An average titre of 20.16 mL was obtained. Find the concentration of acetic acid in the original sample in \%m/v.
a) Write the balanced overall equation for the reaction taking place in the conical flask between
 the ethanoic acidl and the $\mathrm{NaHCO}_{3}$.
b) Find the mol of $\mathrm{NaHCO}_{3}$ in the average titre
c) Find the mol of acetic acid in the conical flask.
d) Find the concentration, in $\mathrm{mol} / \mathrm{L}$, of acetic acid in the volumetric flask
e) Find the concentration in $\mathrm{mol} / \mathrm{L}$ in the original undiluted sample
f) Find the concentration of acetic acid, in $\% \mathrm{~m} / \mathrm{v}$, in the original sample .

Unpack the information by drawing a flow diagram.
